Cherry Hill (New Jersey) forecast issued: 12 am Friday 04 December 2020 local time Issued: 12 am Friday 04 December 2020 local time Period of time during which the sun is no more than 6 degrees below the horizon, either at sunrise or sunset. The horizon should be clearly defined, and the brightest stars should be visible in good atmospheric conditions (i.e. without moonlight or other lights). One still should be able to perform ordinary outdoor activities. The period of time during which the sun is between 6 and 12 degrees below the horizon, either at sunrise or sunset. The horizon is well defined, and the outline of objects could be visible without artificial light. Regular outdoor activities are not possible at this time without additional lighting. The period of time during which the sun is between 12 and 18 degrees below the horizon, either at sunrise or sunset. The sun does not contribute to the illumination of the sky before this hour in the morning, or after this hour in the evening. At the beginning of the astronomical twilight of the morning and at the end of the astronomical twilight in the evening, the illumination of the sky is very dim and could be undetectable. Civil time sunset minus the time of Civil Sunrise.The real time Sunset minus the time of Real Sunrise. The change in length of the day between today and tomorrow is also listed when available. Temperature is a measure of the heat or cooling of an object or substance with reference to a standard value. It can be measured in Kelvin (K), Fahrenheit (F), or Celsius (C). Air moving relative to the surface The wind develops due to differences in pressure in the air. A high pressure and low pressure zone oppose each other and establishes a pressure gradient force that goes from high pressure to low pressure. This force creates a wind wind air is pushed in the direction of function. The stronger the pressure difference, the stronger the force and the stronger the resulting wind. The wind is described as the predominant direction whose wind blows like a speed in units of miles per hour or knots. The force exerted by the weight of the atmosphere and gravity. Different units: atmospheres (atm), millibars (mb), pascals (Pa), mercury inches (in), pounds per square inch (PSI), etc. Meteorologists most often use MB. Rain measured over a certain period of time (e.g. daily, monthly, annual). That part of the electromagnetic spectrum between 5 - 400nm.
